This wall-mounted all-in-one model is a great performer for year-round use as it works as a powerful air conditioner in the summer and a cost-effective heater in the winter. It functions as a dehumidifier too, which is great for keeping damp and moisture at bay. This air conditioner boasts an impressive BTU rating that's ideal for cooling spaces up to 30 sqm, without taking up vital floor space. The heater only requires a small amount of power to operate, which makes it an incredibly efficient way of heating your room, compared to electrical or central heating.

Advanced scheduling - Set the air conditioner to automatically run at different temperatures at different times of the day. Scheduling saves you money as air conditioning will only operate when it is needed.

As with any heat pump-based heater, the performance can reduce at lower outdoor temperatures, and as such it is advisable to have supplementary heating available when outdoor temperatures are sub-zero, especially if the room is poorly insulated

When the unit self-evaporates any humidity in the air and expels it out of the rear vents. It will do this provided the humidity level is not too high, then it will condense the humidity and it will flow through the drain hose.

Hi Doug! By comparing this product to other units I can say that it is worth its price as the quality is high. Most importantly, you can mount it without any outdoor unit, for me, it's a huge advantage. I'm not sure about the hole size, but you should use a 180 or 182mm core drill to drill the two holes. And the noise level can reach 58 db. I hope it helps, thanks!

Hi Tom!The minimum temperature you want it to work can be set up through the mobile app.Everything is explained in the manual handbook available for you to download at the product's page under "What's in the box. Don't worry about the outside temperature, as it will adjust the home temperature to your individual needs. I hope it helps, thanks!
