

200w wind turbine kit

200w wind turbine kit

This 200W 12V wind turbine provides a reliable source of electricity for all types of off-grid applications. This turbine is designed for use in a wide range of locations with varying degrees of wind speed. For example, in high wind areas such as open fields, coastal areas, and high ground, as well as in low wind areas when raised on a suitable pole. It is suitable for both stationary applications (remote, off-grid, backup) as well as for mobile use (e.g. boats).

This wind turbine is also the perfect addition to any solar charging kit to supplement energy production (particularly useful for charging at night time or in countries with reduced winter sunlight).

The maximum output of this wind turbine is not strictly limited to a specific power rating. Although this wind turbine is rated to produce 200W at a wind speed of 10 metres per second, when exposed to strong winds it has the potential to exceed its nominal rating.

Installation and assembly of this wind turbine is extremely simple. For further information, please refer to the detailed user manual supplied with this product. Please note: The picture above and component list in the user manual are not entirely accurate and shows a different connector type to the tube connector which is supplied.

The base of this wind turbine features an adjustable tube connector (diameter 54mm) which can be expanded to accommodate a wider pole or secured around a narrower pole using bolts and additional holes. We recommend using a metal pole for mounting (e.g. a scaffolding pole) rather than poles made of timber or plastic, which may pose a safety hazard.
