

Bess 50 kWh

Bess 50 kWh

Rated power operation the maximum temperature of the battery is less than 40°C. EMS, hybrid inverter and BMS integrated technology, power supply redundancy design, support black start function, grid operation, etc. Suitable for high-rate cyclic.

The EG Solar ESS product line provides BESS with complete electrical energy storage and management system that can be configured to perform numerous functions - from reducing the intermittency of renewable generation sources to performing ancillary services in power substations.

The system consists of an energy control and management solution which coordinates the operating modes and optimizes their performance, ensuring higher efficiency and better use of energy resources, in addition to providing operational flexibility and energy supply reliability.

Commercial battery storage systems are large-scale energy storage solutions, akin to big power banks, designed to store and release electricity from various sources. These systems vary in size and capacity, ranging from 50 kWh to 1 MWh, making them suitable for small- to medium-sized organizations.

With a modular structure, these systems can be customized to meet specific applications and customer needs. They are widely used in facilities like schools, hospitals, petrol stations, shops, and industries to manage energy requirements effectively.

Commercial battery storage systems help support the grid by balancing demand fluctuations, providing backup power during outages, and integrating with renewable energy sources like wind and solar. They can also reduce electricity bills and create new revenue opportunities, making them a cost-effective solution for many businesses.

Our advanced commercial and industrial energy storage systems allow companies to mitigate economic risk with on-site independent backup power to essential equipment while helping to insulate operating expenses from utility rate increases and fluctuations in power supply.

Our C&I solutions are designed for low or high voltage single, split or 3 phase electrical architecture and easily integrates with a broad selection of high power inverters, power control systems, and energy management systems.

Yes, commercial battery storage systems can be connected with photovoltaics (PV) to create a solar-plus-storage system. This configuration allows you to store excess solar energy generated during the day and use it at night or during grid outages. It enhances solar power self-consumption and reliability while reducing demand costs and grid fees.
