

## Eco lithium battery problems

Typically, battery swelling is a symptom of a variety of problems. For example, this could be due to something as simple as usage, such as overcharging or using the wrong voltage. Or, the...

Now, check out these common problems and troubleshooting solutions! 1.Capacity Loss / Insufficient Capacity. Solution: Please keep the battery in 25°C environment, and charge the battery to the full and then discharge it to empty at 0.5C rate.

So in here in this post, we share with you some of the most commonly seen root causes to lithium-ion battery accident and their solutions. Hope our post help you with what you need. Symptom 1: Low voltage. If the voltage is below 2V, the internal structure of lithium battery will be damaged, and the battery life will be affected.

One frequent lithium-ion battery problem is rapid discharge. If you notice your device's battery draining faster than usual, it might be due to a defective battery or an energy-hungry app. Another issue is the failure to charge. This could be due to a faulty charger, a damaged charging port, or the battery itself.

Environmental Impacts of Lithium-ion Batteries. Storing energy in lithium-ion batteries offers a set of advantages that can help us achieve sustainability goals considering energy use: for instance, allowing us to ease our reliance on fossil fuels in favor of renewable energy resources and lithium-ion batteries.

Lithium batteries (Lifepo4) are becoming more and more common in daily life.What would you do if you're experiencing issues with the lithium battery? Now, check out these common problems and troubleshooting solutions!

Solution: Please keep the battery in 25°C environment, and charge the battery to the full and then discharge it to empty at 0.5C rate. Low temperature, excessive charge and discharge current, and the accuracy of measuring instruments will all affect the test results.

(3) The consistency between the cells inside the battery have declined with the increasing cycle times. At this time, it may not charge to the maximum rated voltage. This is normal and will not affect the battery function.

Solution: Please choose the correct charger, or set the charging voltage of the solar controller to a reasonable voltage. Also ensure that the charging rate will not exceed the allowable range of the battery, and keep the battery in an optimum temperature and ventilation environment.

6.The battery fully charges quickly and then drains quickly.(1) The charging and discharging current exceeds the rated current.(2) The battery capacity has decayed for the long time use.Solution: Make sure that the

charging and discharging current at the reasonable range of the battery, or replace it with a new one if the battery lifespan is closed to the maximum limit.

7. Battery voltage exceeds maximum rated voltage. (1) The battery voltage may reach the BMS protection voltage when it is fully charged in the solar system, then the BMS will shutdown. The voltage displayed by the controller is the voltage of the solar panel which is not the battery voltage. (2) One of the batteries' BMS is in the shutdown protection state when several batteries are connected in series. The voltage you check at this time is not the really voltage of the batteries. Solution: Please cut off connection between batteries from the battery bank and test them separately.
