

Electric car battery

The result: peace of mind and high-performing, traceable EV batteries. Partner with Zebra and ensure systems meet ever-increasing market demands, maintaining highest quality EV battery standards now and in the future.

Offering the deepest portfolio of machine vision hardware and software, Zebra's solutions adapt to a wide range of automation and EV manufacturing needs, helping minimise total cost of ownership and empower you to seamlessly scale production.

Effortlessly integrate Zebra machine vision into EV manufacturing processes. Integrated software simplifies configuration and development and deploys from select devices, while product training and support ensure a smooth overall experience.

Zebra's broad portfolio of vision software, 3D devices, smart cameras, barcode readers, frame grabbers and more work seamlessly with each other and third-party systems, ensuring your EV operations remain agile and ready for the future.

Accelerate and improve EV battery manufacturing from cell component inspection through final assembly. Explore machine vision solutions from Zebra that fit across every stage of production to help manufacturers keep up with evolving regulations and rising demand--all while optimising yields.

Transform EV battery production with Zebra's cutting-edge machine vision solutions that improve accuracy, precision and traceability at every stage of production. Maximise flexibility and efficiency to keep your operations agile and future ready.

We have dismantled and handled 1000+ HV batteries and have very high knowledge and great expertise in this area. We are very environmentally conscious and big advocates for Reuse, Repurpose & Recycle of many products we have in our day-to-day lives. With the Electric Vehicles (EV) market really starting to gain momentum, the number of second-life EV batteries on the market is growing rapidly .

We are really keen to get these batteries repurposed into a new useful application rather than allowing them to be discarded in recycling or landfill. The more we can assist and facilitate this industry the better it is for the whole environment.

It is believed that the reuse and repurpose of EV batteries should reach approximately 97% with only 3% going to landfills within the year 2023, and we want to be a part of helping make this happen.
