In any case, the energy mix in Switzerland is less of a burden on the climate than in other countries: According to the Swiss Federal Office of Energy, 62% of electricity currently comes from renewable sources, the largest of which being hydropower. In addition, the efficiency of electric vehicles is massively higher than that of cars running on gas or diesel.

When it comes to the environment, factors such as fine dust or water pollution must also be considered. This was previously the most significant argument from critics – when compared with combustion-powered vehicles, more environmental pollution is generated during the production and disposal of electric cars as a result of energy-intensive battery manufacture.

One study from the Paul Scherrer Institute, published by the Swiss Federal Office of Energy in a fact sheet, shows that electric cars now have a much more favorable environmental footprint. This is because manufacturers have heavily invested in more environmentally friendly production methods and systems. While the manufacture and disposal of electric vehicles still places more of a burden on the environment than is the case with conventional vehicles, when taking into account the operating life, electric vehicles have a significantly more favorable environmental footprint.

The lack of sound coming from the engine is the most noticeable aspect of driving an electric car for the first time. Does this mean that, in a world of electric mobility, people living on busy streets could sleep better and the quality of life in cities will improve? Yes and no – only at lower speeds of up to 20 km/h are electric cars really quieter than conventional vehicles. At higher speeds, tire noise becomes much more relevant than engine noise.

The question of which drive form has more future potential is easy to answer: Electric vehicles are at a clear advantage here. For company fleets, for example, which account for a sizable share of the new vehicle business, purchasing electric vehicles is increasingly becoming a "hygiene factor". The EU has decided that from 2035, only vehicles that do not produce CO₂ emissions may be newly registered. This is also a signal that the era of conventionally driven cars is coming to an end. So here the point clearly goes to electric vehicles.
