Electricity generation georgia

Last Updated: February 15, 2024 Overview Major highways and the world's busiest passenger airport helped make Georgia seventh in the nation in transportation sector energy consumption in 2021.

Georgia has no utility-scale wind-powered electricity generation.⁵⁵ The state has limited onshore wind energy potential, all of it in small areas on the mountain ridges along the state's northern border and in a narrow strip along the state's 100-mile Atlantic coastline. However, Georgia has additional wind resource potential offshore in the Atlantic Ocean.^{56,57}

Georgia does not have any crude oil production or proved petroleum reserves.^{67,68} None of the nearly 200 exploration wells drilled in the state during the 20th century were successful.^{69,70} Georgia's last crude oil refinery closed at the end of 2014.^{71,72} No crude oil pipelines cross the state, and Georgia receives refined petroleum products from two interstate petroleum product pipeline systems and an interstate propane pipeline.⁷³ The Port of Savannah also receives petroleum product imports from around the world.⁷⁴
