

Ev charging station for profit

Ev charging station for profit

This article will break down different charging fee strategies, and includes a table of gross monthly revenue estimates based on a variety of situations and locations that include (and combine) AC and/or DC charging stations, by looking at multiple common EV charging behaviors.

Beyond direct revenue, EV charging stations can also help attract new customers by putting your business on the map, increase the time they spend at your location, unlock cross-selling opportunities, and enhance your sustainability credentials.

Installing EV charging stations today is about more than just preparing your location for this shift in transportation--it's also a clearcut path to attracting more customers and generating more profit. Below are a few examples of how adding public EV charging can make your existing business more profitable, as well as become a revenue stream all on its own.

In today's competitive landscape, businesses must think of creative ways to attract customers while also boosting the value of each transaction. Transforming your location into an EV charging destination is one of the simplest ways to do just that.

Once EV drivers stop to charge, there is an obvious cross-selling opportunity for add-on products and services. Whether it's a rideshare driver recharging during a lunch break or a little league coach topping off his battery while getting snacks for the team.

Depending on the type of charger you choose, EVs can take anywhere from a few minutes to a couple of hours to charge (depending on battery size). For shops, restaurants, or gas stations, a fast (DC) charging solution is an ideal choice, charging even the largest EV batteries in under an hour.

However, since most EVs coming to your location aren't looking to charge from 0-100 percent, a standard Level 2 (AC) charging solution can also suit most driver needs, allowing them to add ~25 miles of range per hour. In many cases, a mix of AC and DC charging stations is the best solution.

Our research, in partnership with Ipsos, found that EV drivers are more educated, wealthier, and younger than the average population. With more disposable income than gas-car drivers, your EV-driving customers will not only spend more time at your location but also purchase higher-end goods and services every time they visit. Plus, these drivers are likely to turn into loyal, repeat customers once they know your business offers this valuable service.

According to the EY Mobility Consumer Index, 52 percent of car buyers are considering an EV for their next purchase. As a consequence, locking in your location now as one of the places that provide EV charging could

Ev charging station for profit

turn your business into an often-frequented EV charging destination.

EV charging stations also put your business on the map--literally. Popular navigation sites like Google Maps or Waze, and dedicated charging apps such as PlugShare feature interactive maps that enable drivers to locate nearby public charging stations. By having charging stations at your site, you can boost your brand visibility on these platforms and attract new customers.

Plus, with customized charging stations that display your brand colors or logo, you can drastically improve your corporate image by letting everyone who sees them know that your organization is openly committed to a more sustainable future.

Environmental concerns are increasingly top-of-mind for your customers. By having charging stations on your property, you can establish your business as an eco-conscious organization--and even earn some prestigious sustainability certifications for your location (LEED, GBB, WELL).
