

Gabon energy storage policy

We aim to reduce our greenhouse gas emissions by half by 2025, measured against 2015 levels, provide universal access to affordable and clean energy by 2030, and ensure the conservation and sustainable use of terrestrial and inland freshwater ecosystems and their services.

developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided

It introduces the different ways in which storage can help meet policy objectives and overcome technical challenges in the power sector, it provides guidance on how to determine the value of storage solutions from a system perspective, and discusses relevant aspects of policy, market and regulatory frameworks to facilitate storage deployment.

Almost two-thirds of the population of Gabon has access to electricity. The country can partially rely on its 150 thousand barrels per day hydrocarbon liquids production and has recently implemented a new petroleum legislation.

This infographic summarizes results from simulations that demonstrate the ability of Gabon to match all-purpose energy demand with wind-water-solar (WWS) electricity and heat supply, storage, and demand response continuously every 30 seconds for three years (2050-2052).
