Home install solar panels

So many people want to go solar but wonder what the steps are to install solar panels. If that's you, we have some information you should enjoy. It is a guide to installing solar panels, and we keep it short and sweet.

You want to make sure you understand the warranty terms for the physical pieces of your array and the labor, shipping, and installation should a part require replacement. Here are a few other questions people commonly ask.

You can install solar panels on your home yourself. You will need some electrical wiring experience, and we suggest that you also use a professional solar contractor or electrician to do the wiring and connection processes to ensure that you:

It is not overly difficult to install solar panels. They fit onto a frame and then are fastened into place. However, installing the entire solar array can be more challenging, especially if you do not have electrical wiring experience.

The basic system is to start with the installation of a rack or platform. If the panels are roof-mounted, a roof racking system is first installed. A ground platform is needed if the panels are ground-mounted, and installing the solar panels is not difficult.

The Goal Is to find the best location for the array to receive the most sun and the best quality sunlight. That ideal location may be the roof of your house, garage, or barn, or it may be on a platform on the ground.

The best angle for solar panels will depend on where you are in the world. Direct south is best for most applications. Because the sun moves throughout the day, the south is the best location unless you use solar trackers.

It is a lot of physical work to dig a trench or attach the pipe to the side of the house, and you will appreciate the fact that the chore is done as you get near the end of the array installation.

The regulations for depth of buried conduit differ depending on the application, conduit material, and its location. Be sure to check with your local government building authority for final depths.

The deepest requirement is 24-inches or two feet, and the shallowest is four inches. When in doubt, dig the trench to 24-inches. Be advised that you may need a permit or inspection for a buried electrical conduit, and you may also need to contact your gas company.
