

How to make my batteries work for a short time one last time

How to make my batteries work for a short time one last time

You will often find that batteries will give a last little bit of juice - especially when cold - by gently warming them to body temperature - so pop them inside your clothes for ten minutes or so or rub them briskly between your hands for a short time. Also turn them in place to ensure that the contacts are as clean as possible.

I have always just dropped the batteries on the floor to get more juice out of them. I don't know why it works, but I suspect that it has something to do with the fact that the batteries rely on a physical phenomenon (chemical energy) and that a good shock mixes it up enough to get more juice out. Maybe the shock breaks crystals that have formed in the reactants?

If your device requires at least two batteries oriented in different directions, switch the batteries' positions. This will alternate the direction of current and squeeze a little more juice out of them. Not much, but usually enough for 10-15 minutes, depending on your device.

You can partially recharge certain types of non-rechargeable battery by putting them in a battery charger. They don't advise this but I'm not sure whether that is because it will decrease sales of new batteries or because it might be dangerous. I suspect the answer depends on the type. I've certainly done it with the old-style (zinc-carbon?) batteries. ISTR that repeated attempts have less and less success so its only a temporary fix...

Hold the battery firmly at one end, then using your thumb and index finger of the other hand firmly rub the battery so you can feel a friction burn, do this all over the battery, I don't notice any difference in terms of what direction you rub. Do this strongly for about 5 minutes, should prolong their life significantly.

Something that I have done is just leave the <dead> batteries aside for a day, and they should be 3/4ths full the next, after which will actually, and finally die. I just came to this site to find a better way. SUNBEAM AA 1.5V

I have three or four batteries lying beside my keyboard. They are used until they are fully out of energy. I just re-use one until it stops working, then go on to the next. Sometimes I get a whole day of use from them by alternating and overnight they sit idle until the morning when they start working again. Of course, this does not last forever, so I have new batteries at the ready. Still, I think it is a shame when people just throw them out the first time they stop.
