

Kuwait city electric vehicles evs

In electric cars range might be one of the most important stats you will be looking for. So let's start with a quick definition. The range just like in a petrol-powered car means the distance you can travel before you need to refuel or recharge your car.

Currently, when we plan a trip with our petrol-powered cars we hardly think about where are the petrol stations along the route. In contrast to that once you leave your home in your new electric car, knowing that there is a long journey ahead, locating the nearest electric charging station and its Power source is a must. Luckily you can do that now from the palm of your hand using your mobile phone. Many websites and apps offer locations of these charging stations and help you plan for your trip.

We know what your thinking! Electricity and water don't mix. But just like with your petrol-powered car, electric cars can be driven through a certain wading depth depending on the model. So electric car manufacturers make sure to water proof the car depending on what type of vehicle it is. So wading depth will vary a lot between a sports electric car like the Audi e-tron GT and something like that new Ford F-150 Lighting.
