

Li titanate battery

Li titanate battery

The lithium-titanate or lithium-titanium-oxide (LTO) battery is a type of rechargeable battery which has the advantage of being faster to charge than other lithium-ion batteries but the disadvantage is a much lower energy density.

According to a Weatherflow Co. article, the Tempest weather-station device contains a 1300mAh LTO battery, charged via four solar panels, requiring "at least 4 hours of adequate sunlight every two weeks."

The Combustion Predictive Thermometer is described as using an LTO battery. According to Combustion Inc., this allows it to safely survive temperatures up to 105°C (221°F) inside of ovens.

A disadvantage of lithium-titanate batteries is their lower inherent voltage (2.4V), which leads to a lower specific energy (about 30-110Wh/kg) than conventional lithium-ion battery technologies, which have an inherent voltage of 3.7V. Some lithium-titanate batteries, however, have an volumetric energy density of up to 177Wh/L.

The Log9 company is working to introduce its tropicalized-ion battery (TiB) backed by lithium ferro-phosphate (LFP) and lithium-titanium-oxide (LTO) battery chemistries. Unlike LFP and LTO, the more popular NMC (Nickel Manganese Cobalt) chemistry does have the requisite temperature resilience to survive in the warmest conditions such as in India. LTO is not only temperature resilient, but also has a long life.

Altairnano has also deployed their lithium-titanate energy storage systems for electric grid ancillary services as well as military applications.

Grinergy is a South Korean battery manufacturer founded in 2017. It offers commercial and Warfighter military grade LTO battery technology. Grinergy is a 2023 CES Innovation Honoree.

Leclanché is a Swiss battery manufacturer founded in 1909. In 2006, it acquired Bullith AG (Germany) to establish a Li-Ion manufacturing line in Germany. In 2014, their product "TiBox" entered the market. The energy content of the TiBox is 3.2kWh, with an expected 15,000 cycle life span.

Microvast, based in Houston, Texas, makes a lithium-titanate battery that it calls "LpTO". In 2011, the world's first ultrafast charge bus fleet was launched in Chongqing, China. An 80kWh LpTO battery system was installed in 37 twelve-meter electric buses, which can be fully charged within 10 minutes with a

Li titanate battery

400 kW charger.[27]

As of 2014, a British bus OEM, Wrightbus, began using Microvast LpTO batteries for 1,000 units of double-decker New Routemaster buses.[citation needed] An 18 kWh LpTO battery system is used to replace the initial Lithium Iron Phosphate battery because the LFP battery encountered performance failure.

As of 2015, the European ZeEUS (zero emission urban transport system) was first offered. Its VDL bus uses a 62.5 kWh LpTO battery system from Microvast[28] for a demonstration project.

As of 2016, the world's largest automated port, PSA TUAS, began using the Microvast LpTO for 22 electric AGVs as a first phase of a project for horizontal container transportation.[29]
