

Monaco home energy storage

Surnommées « énergies propres » ou « énergies vertes », leur exploitation engendre très peu de déchets et d'émissions polluantes.

Les énergies renouvelables les plus connues sont l'énergie solaire et éolienne mais il en existe de nombreuses autres. Par exemple l'énergie hydraulique désigne les énergies provenant de l'eau, par exemple l'énergie des vagues (houlomotrice), des marées (marémotrice) ou des courants (hydroliennes ou barrages hydroélectriques). La biomasse et la géothermie sont d'autres exemples.

Elle est accompagnée par le pôle de compétitivité Capenergieset Accenture afin d'établir des états de l'art des différentes technologies d'intérêt et évaluer les solutions proposées.

Renewable energy in Monaco is becoming more common today. From seawater heat pumps to solar power, these are resources that are not easily depleted within our lifetime and Monaco looks to become a more green country. Renewable energy allows for better energy efficiency and reduces greenhouse gas emissions, which in turn helps with combating changing weather patterns.

The most common types of renewable energy in Monaco come from sunlight and wind power. The country is utilizing these two resources in many places. There are also other types of renewable resources, such as hydropower and geothermal energy.

Solar panels take energy from the sun and transfer it into usable energy for the building or space that the solar panels are connected to. There are two types of solar panels used in Monaco today: solar photovoltaic panels and solar thermal panels.

Solar photovoltaic panels are used to take energy from the sun and transfer it into electricity. Most of these panels are found on top of buildings, such as schools and office buildings. There are also some residential buildings that use solar panels. All of these buildings use this energy to meet their needs for electricity, such as lighting. One of the most well-known projects in Monaco for solar panels has been the installation at École des Revoires School. These panels allow for optimal capture of sunlight and allow the school to be self-sufficient in heating water.

Thermal panels, on the other hand, use energy to heat water areas. Currently, many swimming pools, such as the pool in the Ecole St Charles building, are being heated by these panels but there are other uses for this type of solar panel.

Monaco home energy storage

Seawater heat pumps take energy from the sea and transform it into energy to heat or cool buildings. These pumps are able to extract either warm or cold water from the sea, in Monaco's case that sea being the Mediterranean.

Seawater heat pumps are currently being used to produce almost 20% of Monaco's energy. The pumps are a much more sustainable solution to the world's energy problems, as they produce energy three to four times more than they consume.

Monaco offers many accommodations to eliminate carbon-burning transportation. The principality has a public bus system, electric bikes, electric car-sharing services and even a solar-powered water bus.

Monaco has implemented incentives for citizens to use green transportation. Parking passes have reduced fees for those traveling in electric or hybrid vehicles. There is also a discounted price for car sharing, helping struggling families.
