

## Niue europe renewable energy

Ambassador Plinkert arrived in Niue on Friday 13 September 2024. During her visit, she will engage in a series of meetings with government departments and stakeholders to discuss ongoing and future cooperation. A key highlight of her visit includes touring EU-funded project sites, such as the new oxygen plant at Niue Foou Hospital and various water tank projects across the island.

The EU has been instrumental in supporting Niue's energy sector through various initiatives focused on renewable energy production and energy efficiency. From 2014 to 2020, these collaborative projects significantly benefitted Niue's energy infrastructure.

"It is a privilege to welcome the EU Ambassador to Niue, Her Excellency Barbara Plinkert. The European Union's support over the years has been invaluable in advancing our nation's development. From strengthening our energy sector to enhancing critical infrastructure, the EU's contributions have played a vital role in Niue's progress. We look forward to continuing this strong partnership and exploring new opportunities for collaboration that will further benefit the growth and well-being of our island."

The Government of Niue wishes the Ambassador a safe journey as she departs the island at the end of the week and looks forward to further strengthening its cooperation with the European Union in the future.

Many of us want an overview of how much energy our country consumes, where it comes from, and if we're making progress on decarbonizing our energy mix. This page provides the data for your chosen country across all of the key metrics on this topic.

In the selection box above you can also add or remove additional countries and they will appear on all of the charts on this page. This allows you to compare specific countries you might be interested in, and measure progress against others.

In the energy domain, there are many different units thrown around - joules, exajoules, million tonnes of oil equivalents, barrel equivalents, British thermal units, terawatt-hours, to name a few. This can be confusing, and make comparisons difficult. So at Our World in Data we try to maintain consistency by converting all energy data to watt-hours. We do this to compare energy data across different metrics and sources.

Electricity is a good that adds massive value to modern life: from having light at night; to washing clothes; cooking meals; running machinery; or connecting with people across the world. Many would argue that it is a crucial for poverty alleviation, economic growth and improved living standards.<sup>1</sup>

Having clean fuels and technologies for cooking - meaning non-solid fuels such as natural gas, ethanol or even electric technologies - makes these processes more efficient, saving both time and energy.
