

Reduced carbon emissions georgia

Reduced carbon emissions georgia

Drawdown Georgia aims to accelerate progress toward net zero greenhouse gas emissions in Georgia. Our team of university researchers (from Georgia Tech, UGA, Emory, and Georgia State), and community partners (Southface Institute, Greenlink Analytics, Partnership for Southern Equity, and others) is providing a science-based approach to achieving the Drawdown Georgia goal.

They all provide state-of-the-art information with some original calculations, assessments, and policy analytics. In 2024, there are both research papers and voiceover PPTs. In 2022, videos are hot-linked to each of the project titles, but there are no links to papers. Open the files and then play them to hear each team of graduate students talk about their findings.

Two projects covered sustainable agriculture and agroforestry, three examined EV charging infrastructure and battery recycling, and two projects focused on rooftop solar and demand response to manage peak loads.
