

Residential energy storage ulaanbaatar

The project aims to help Ulaanbaatar's ger area residents access cleaner heating appliances, scale up the efficiency of household energy use, and support measures to reduce levels of particulate matter in the air.

Ulaanbaatar is among the most polluted cities in the world. About half of its 1.4 million residents live in informal ger areas without access to district heating. To keep warm in winter, residents rely mainly on stoves and low-pressure boilers burning coal and wood -- one of the leading causes for high levels of air pollution in winter and smog-induced public health problems.

The UBCAP was first approved in April 2012 with a total of US\$15 million in financing to help ger area residents gain access to heating appliances that produce less particulate matter emissions and to develop measures to reduce particulate matter in Ulaanbaatar in coordination with development partners. The project distributed more than 40,000 clean stoves between 2013 and 2015. A pilot program on residential energy efficiency improvement financed under UBCAP supported 472 residential houses in ger neighborhoods and 12 government buildings.

"Ulaanbaatar's air quality challenges cannot be solved with one single solution: multiple abatement measures need to be pursued simultaneously in the short-to-medium term. One such measure is the access to clean and energy efficient heating appliances, which is crucial to the well-being of the most vulnerable residents of Ulaanbaatar," said Andrei Mikhnev, World Bank Country Manager for Mongolia. "Through this project we are delighted to expand our support to Mongolia to help address these challenges."

A new component added under the additional financing is a demonstration program on electric heating with thermal storage. The component will introduce heaters that can store surplus electricity produced during winter nights from combined heat and power plants and wind farms and use it back for clean heating for the entire day. Combined with energy efficiency measures, experiences and lessons learned will inform the design of the government's electric heating program, which aims to provide electric heating for more than 40,000 ger households.

The Bank is also supporting the government to develop a broader program to tackle air pollution in the longer-term, including rehabilitation and expansion of the district heating network, scaling up decentralized clean heating solutions and building energy efficiency in ger areas.

Approach to Transformational Change: The "Mongolia – Energy Performance Contracting for Residential Retrofitting in Ulaanbaatar City" project is designed to jump-start a large-scale thermo-technical retrofitting (TTR) program and create the market conditions to scale up investments in energy efficiency.

Mitigation potential: The project aims to directly mitigate 2.4 Mt CO₂e over the lifetime of its interventions at

a cost efficiency of 15 EUR/tCO₂e plus an additional 2.3 Mt CO₂e of indirect emissions will be mitigated due to continuous retrofitting efforts.

All articles published by MDPI are made immediately available worldwide under an open access license. No special permission is required to reuse all or part of the article published by MDPI, including figures and tables. For articles published under an open access Creative Common CC BY license, any part of the article may be reused without permission provided that the original article is clearly cited. Feature papers represent the most advanced research with significant potential for high impact in the field. A Feature Paper should be a substantial original Article that involves several techniques or approaches, provides an outlook for future research directions and describes possible research applications.

Editor's Choice articles are based on recommendations by the scientific editors of MDPI journals from around the world. Editors select a small number of articles recently published in the journal that they believe will be particularly interesting to readers, or important in the respective research area. The aim is to provide a snapshot of some of the most exciting work published in the various research areas of the journal.
