This follows a prior loan in 2016 for Mobisol's operations in Tanzania, Rwanda and Kenya. The company already has 10MW installed in the region providing electricity to households and small businesses in low-income communities.

The projects provide rural families and business owners with power for a range of appliances, such as televisions, stereos and refrigerators to improve their standard of living and earn incremental income through solar-powered businesses, such as mobile phone charging stations, barber salons, movie theatres and more.

"Mobisol is very pleased about the sustained support from Finnfund, which allows us to further 'plug in the world' and connect more people to a reliable source of energy," said Thomas Gottschalk, chief executive at Mobisol. "This is not only adding to the socio-economic growth in insufficiently served regions in East Africa, but also contributes to a greener and more sustainable future globally."

17 July: Acciona Energía has signed an alliance with one of the biggest retail store chains in Latin America, SACI Falabella, to supply energy from renewable sources to almost 100 centres of various brands in Chile.

Acciona has already started supplying electricity to the first stores and six shopping malls of the Falabella group. In 2018, it will add the remaining centres that can feasibly be connected, including the two main distribution centres of Falabella and Sodimac.

SACI Falabella CEO Sandro Solari said: "This agreement not only means a major saving in costs, it also ties in with our efforts in the area of sustainability to reduce the impact of our operation on the environment".

18 July: The Clean Energy Finance Corporation (CEFC) saw a substantial increase in investment commitments in FY 2016/17 with AU\$2.1 billion, up from AU\$837 million in the previous fiscal year.

CEFC chief executive Ian Learmonth said: "Australia's clean energy sector is coming of age, with investment activity increasingly stretching across the economy. The accelerated pace of CEFC commitments in the past financial year reflects an improved policy environment and increased investor confidence. As a specialist investor in clean energy in Australia we welcome the increasing investor recognition of the diverse uses and considerable positive benefits of clean energy, from renewables to energy efficiency and low emissions technologies."

12 July: China-headquartered PV inverter manufacturer Sungrow has supplied a complete energy storage

# Retail store energy storage bahamas

system to a commercial and industrial (C& I) solar-plus-storage project in the Bahamas.

Unlike the company's recent five-island microgrid project in the Maldives, the Bahamas system, at an unnamed customer's site, is thought to be grid-connected. It provides behind-the-meter services such as load shifting and peak shaving and can also operate independently of the grid.

Coupled with a ground mounted solar installation, of which capacity was not disclosed by Sungrow, the project incorporates 500kWh of lithium-ion battery energy storage coupled with Sungrow's SC250KU energy storage inverter, which is UL-certified.

Sungrow said one of the advantages of the system design is that the inverter and energy storage units are housed separately. The company claims this helps keep installation costs down, and makes operations and maintenance (O& M) tasks easier. The system also has air-conditioned cooling and fire prevention features.
