

Samsung 22 ultra fast charger

Samsung 22 ultra fast charger

You certainly can! The 25W and 45W limitations on the Samsung Galaxy S22 series don't limit you from buying a charger with more wattage. A faster charger will be limited to the 25W and 45W caps Samsung has, though. This means that if you get a 100W charger and try to juice up your base Galaxy S22, the device will still charge at 25W.

With no charger in the box and a changed set of charging specifications, picking the best plug to power your Samsung Galaxy S22 series is probably the last thing you want to do after picking up your phone. But it needn't be a headache. Whether you're reusing an old plug or buying a new one, there are plenty of chargers on the market to suit your needs.

Here at Android Authority, we've tested many chargers and assembled the perfect collection to fast charge your new smartphone. Here's everything you need to know to pick the best Galaxy S22 charger.

Samsung recommends its Super Fast Charging 2.0 45W travel adapter to charge the Galaxy S22 Plus and S22 Ultra quickly, and it's hard to argue with the official line here. With 45W of power and USB Power Delivery PPS onboard, this product will charge all recent Galaxy flagship smartphones at full speed without issue.

Samsung's charger isn't a super cheap option, but it's become increasingly competitive with third-party options in recent months. It costs \$50, but it's now regularly discounted below \$40, often closer to \$30, which is a deal you'll struggle to beat.

That said, we like recommending the 45W charger because it allows you to future-proof yourself. Maybe you'll want to upgrade to one of the newer devices later, or you want to be able to fast-charge other devices you may own. This may even include tablets and other more power-hungry devices.

Anker is a great accessory manufacturer, and its Anker 713 Nano II adapter perfectly meets the required USB PD PPS standard for the Galaxy S22 series. Better still, it comes in various power options to perfectly suit your latest purchase. We recommend the 45W version, as it can power all Samsung Galaxy S22 devices at full speed.

If you have the base Galaxy S22 and don't want to future-proof yourself, you can also go for the Anker 711 Nano II (\$23.99 at Amazon), which is the same charger, but with 30W charging speeds. Alternatively, you can also upgrade to the Anker 715 Nano II charger (\$49 at Amazon), which can juice up devices at 65W. The latter will be a great option if you want to use the charger with tablets or laptops.

If you want to save a bit on a good 45W charger with PPS support, the Spigen ArcStation Pro 45W charger is a great option. It has a neat design and comes with a cable. And while the MSRP is \$30, it is very commonly

Samsung 22 ultra fast charger

discounted to lower prices.

The Anker Prime 100W GaN Wall Charger is more than you'll need to charge any Galaxy S22 on its own, but it's always good to be able to charge multiple gadgets at once. It has two USB-C ports boasting PPS capabilities and a single USB-A port. It's much smaller than previous three-port chargers from Anker, thanks to GaN technology.

The accessory is also relatively small and portable for a three-port charger. It costs \$85, but you can often find it at a discount. But if you think it's a little too much, Anker also makes the Prtime 67W GaN Wall Charger (\$59.99 at Amazon), which is the same, but with less wattage.

The max 65W output is divided across all ports, but you can still reach the Galaxy S22 Plus or Ultra's max 45W speeds if you're charging two or three devices simultaneously. Just make sure to use the first port for the Samsung phone, which gets prioritized. It's also relatively affordable for such a versatile brick, at \$56.
