In it Peter adds a whole world of information to the Victron Energy MultiPlus installation manual. He discusses the practicalities of installing a MultiPlus Inverter in compliance with the standards of the American Boat and Yacht Council (ABYC); he explains what we're looking at when we remove the front panel; and he explains the connection-options to other devices.

This next panel shows the charging circuit for an auxiliary battery such as a starting battery. It has a maximum 4 amp output. The drawing shows that the Aux battery and the Main battery must share a common negative. Then the only wire you need for this is the positive wire. The drawing doesn't show a fuse for this wire but one is required at the battery end. The wire connects to the terminal labelled 'trickle charge' in the middle of the set of green terminal strips.
