Solar eclipse of May 10 1994 wikipedia

Solar eclipse of May 10 1994 wikipedia

* The number of people refers to the resident population (as a round number) in areas where the eclipse is visible. timeanddate has calculated these numbers using raw population data provided by the Center for International Earth Science Information Network (CIESIN) at Columbia University. The raw data is based on population estimates from the year 2000 to 2020.

Shown below are two tables displaying details about this particular solar eclipse. The first table outlines times at which the moon"s penumbra or umbra attains the specific parameter, and the second table describes various other parameters pertaining to this eclipse.[4]

This eclipse is part of an eclipse season, a period, roughly every six months, when eclipses occur. Only two (or occasionally three) eclipse seasons occur each year, and each season lasts about 35 days and repeats just short of six months (173 days) later; thus two full eclipse seasons always occur each year. Either two or three eclipses happen each eclipse season. In the sequence below, each eclipse is separated by a fortnight.
