

Solar grid and inverter

Solar grid and inverter

Installing a battery could reduce your electricity bills, especially if you're on a time-of-use tariff such as Economy 7. You could be charging on cheap overnight electricity and using the battery during the expensive hours.

Solar panels are a great way to generate electricity during the day, but they don't work at night when you need energy the most. Installing a battery can help you make the most of the energy your panels produce. Without a battery, you'll have to rely on the national grid for electricity at night, which can be expensive. However, with a battery, you can store any excess energy generated during the day and use it at night when you need it most. This will help you reduce your reliance on the grid and save money on your electricity bills.

The Sunsynk Connect app helps you get the most out of your solar panel and battery system. The app tracks in real-time how much energy your panels are generating. It gives you the information you need to increase your savings and reduce your energy spending. Features of the app include:

The battery system is designed to be wall or ground-mounted - and is usually installed in the loft of your home. For homes without a loft, the installer will be able to give you alternative options, such as the garage or under the stairs.

The benefits vary greatly from household to household, as everyone uses energy differently and at different times of the day. However, after completing a remote survey, we'll be able to provide you with a custom report showing your home's savings with a solar panel and battery system.

We're excited about the release of the Tesla Powerwall 3 solar battery. This is not just an ordinary battery; it represents a significant advancement in battery technology. Are you interested in learning how it can help you save money, decrease your carbon footprint, and reassure you during power outages? Check out our blog to find out more!

Businesses can generate additional revenues from energy flexibility services. If you install a commercial scale storage system, your business could save money by shifting energy use from high cost to low cost periods.

If you're thinking about getting solar panels, you're going to want to know what you'll spend and save. Solar panels are far easier than you may think to install. As soon as they're up you can start benefiting from solar power! We're here to help you discover everything you need to know about cost and installation.

We're big fans of renewable energy at EDF, which is why we have a range of SEG tariffs to help you turn your exported energy into earnings. Before you can access a SEG tariff, you'll need to fill out a SEG application first.

The Smart Export Guarantee (SEG) is a licensee requirement to offer an export tariff to eligible generators. This tariff is for you where you have installed one of the below technologies with capacity up to 5MW or up to 50kW for Micro-CHP:

Customers also need a smart meter or half-hourly electricity meter and must not already receive payments under the Feed In Tariff (FIT) Scheme or already receive SEG payments from another SEG licensee.
