Solarmax website

We complete an initial site visit to determine the best solar solution for you. We consider factors such as orientation to the sun, surrounding shade and type of roof as well as your requirements as a household.

Our design team specify the most suitable panel system for you. We will make a full recommendation and free quote for your consideration, including government backed performance figures and anticipated savings.

With the panels installed and generating power our electrical partners will fit the inverter to connect the electricity generated to the home energy supply. Our team will also fit any other products you have purchased such as batteries, EV chargers, the iBoost system, or other energy saving devices.

Once connection is completed our electrical contractor will sign off the system and advise the local grid that the system has been installed. Should the system required be greater than 4kW we will work with you to get the local electric grid approval required, known as a DNO application.

Once connection is completed our electrical contractor will sign off the system and advise the local grid that the system has been installed. Should the system required be greater than 4kW we will work with you to get the local electric grid approval required, known as a DNO application.!

Utilizing the best of technology, in a typical grade A panel, can generate over 400 watts of electrical power per hour when the sun's brightest light hits the system, but even in shade today's solar panels can still generate acceptable levels of electrical power.

As well as saving you money on your energy bills, solar panels can also earn you cash. And don't worry, panels can still generate some electricity on gloomy days, vital when the weather's as dull as dishwater.
