

Utility-scale energy storage lusaka

Utility-scale energy storage is revolutionizing how we manage electricity. As demand for renewable energy grows, the need for efficient, reliable storage solutions becomes critical. These systems help balance supply and demand, ensuring a stable electric grid and enhancing the integration of renewable energy sources.

Utility-scale energy storage refers to large-scale battery systems designed to store and distribute electricity at a grid level, supporting battery storage projects. These systems can store energy generated from renewable sources like solar and wind and release it when needed, providing a consistent power supply.

FlexGen is a leader in the field of utility-scale energy storage, offering innovative solutions through their HybridOS platform. This system combines advanced AI-driven optimization, real-time monitoring, and seamless integration with renewable energy sources to deliver superior performance and reliability.

Utility-scale energy storage is essential for the modern electricity grid, providing critical grid-scale storage solutions and improving global energy security. It helps balance supply and demand, integrates renewable energy sources, and provides a stable and reliable power supply through grid-scale batteries. Companies like FlexGen are at the forefront of grid-scale battery storage technology, offering innovative solutions that enhance the efficiency and reliability of energy storage systems.

By investing in utility-scale energy storage, we can pave the way for a more sustainable and efficient energy future, supported by the Department of Energy. As technology continues to evolve, these systems will play an increasingly vital role in meeting our energy needs and supporting the transition to renewable energy.

State-owned power utility Zesco has kicked off the first stage of an engineering, procurement and construction (EPC) tender for a 7.5 MW solar plant in Lusaka province, Zambia. The deadline for expressions of interest is Feb. 16, 2024.

The plant will be built in Kasupe, Lusaka province. Zesco owns 35 hectares of unused land in Kasupe, which have been set aside for the development of renewable energy projects.

According to the tender advertisement, Zesco wants to develop smaller distributed PV plants to help the country harness renewable sources of energy, achieve diversification, and enhance the energy mix. The utility's website says it plans to increase its power generation mix with a minimum of 1,800 MW of renewable energy over the next 10 years.

Figures from the International Renewable Energy Agency (IRENA) show that Zambia had 96 MW of installed solar power at the end of 2021. The government previously set a target of deploying 500 MW of solar by 2023, in order to ease chronic power shortages.
