

Ville neuss tesla solar roof

Other automakers offer it as an option, but the solar roof systems either only power auxiliary features and not the actual powertrain's battery pack, or they only provide a few miles of range per day.

After the launch of the Cybertruck, Musk surprised many when he said that Tesla's new electric pickup truck will have a solar roof option that will add 15 miles of range per day.

This is pretty cool. Now, please don't trash this project based on efficiency and how the weight or aerodynamic drawbacks are more significant than the energy the solar system can bring in.

But this project is more about finding a way to charge the Model Y through solar power off-grid than making a more efficient vehicle that can benefit from a solar roof, like the Aptera. Mission accomplished on that front.

Interestingly, the inventor says that the next version of the product is using a custom roof rack rather than the standard Tesla rack. The new one is sleeker and can be used with a wind breaker for better aerodynamic performance.
