

Wind generator for caravan

Wind generator for caravan

The FM910-4 Furlmatic is without doubt the engineer's choice of micro wind turbine for battery charging at off grid locations. Countless organisations worldwide have installed tens of thousands of Furlmatics because, simply, their reliability in the toughest weather conditions is so well proven.

We publish our curves based on measured data and use ongoing actual performance data collected and monitored over long periods of time of the turbines running in clear and real wind conditions. This means the turbines are also subject to side winds, upwinds and sudden changes of wind direction (these are the causes of turbulence) experienced at a user's typical installation. Our curves represent a truer reflection of the power output you can expect from your Rutland Windcharger compared with many other turbines.

I thought you'd like to know that the one I bought is feeding a weather station on top of a mountain and subject to some of the harshest weather conditions conceivable. The North Atlantic air is very salty and the wind speeds often exceeds 80 m/s. I am told it performs perfectly and that they are very happy with it.
